The LaTeX.mk Makefile and related script tools*

Vincent Danjean Arnaud Legrand

2016/02/09

Abstract

This package allows to compile all kind and complex LaTeX documents with the help of a Makefile. Dependencies are automatically tracked with the help of the `texdepends.sty` package.

Contents

*This file has version number v2.2.2, last revised 2016/02/09.

1 Introduction

`latex-make` is a collection of LaTeX packages, scripts and Makefile fragments that allows to easily compile LaTeX documents. The best feature is that ***dependencies are automatically tracked***[1].

These tools can be used to compile small LaTeX documents as well as big ones (such as, for example, a thesis with summary, tables of contents, list of figures, list of tabulars, multiple indexes and multiple bibliographies).

2 Quick start

2.1 First (and often last) step

When you want to use `latex-make`, most of the time you have to create a `Makefile` with the only line:

```
include LaTeX.mk
```

Then, the following targets are available: `dvi`, `ps`, `pdf`, *file*`.dvi`, *file*`.ps`, *file*`.pdf`, etc., `clean` and `distclean`.

All LaTeX documents of the current directory should be compilable with respect to their dependencies. If something fails, please, provide me the smallest example you can create to show me what is wrong.

Tip: If you change the dependencies inside your document (for example, if you change `\include{first}` into `\include{second}`), you may have to type `make distclean` before being able to recompile your document. Else, `make` can fail, trying to build or found the old `first.tex` file.

Shared work If you work with other people that do not have installed (and do not want to install) LaTeX-Make, you can use the `LaTeX-Make-local-install` target in `LaTeX.mk` to install required files locally in the current directory. You can them commit these files into your control version system so all co-authors will be able to use LaTeX-Make without installing it. However, note that:

- you wont beneficit of an update of LaTeX-Make in your system (you will continue to use the locally installed files)
- there is no support for upgrading locally installed files (but reexecuting the installation should do a correct upgrade most of the time)

2.2 Customization

Of course, lots of things can be customized. Here are the most useful ones. Look at the section 3 for more detailed and complete possibilities.

Customization is done through variables in the `Makefile` set *before* including `LaTeX.mk`. Setting them after can sometimes work, but not always and it is not supported.

Which LaTeX documents to compile `LU_MASTERS`

Example: `LU_MASTERS=figlatex texdepends latex-make`

This variable contains the basename of the LaTeX documents to compile.

If not set, `LaTeX.mk` looks for all `*.tex` files containing the `\documentclass` command.

[1] Dependencies are tracked with the help of the `texdepend.sty` package that is automatically loaded: no need to specify it with `\usepackage{}` in your documents.

Which LaTeX main source for a document *master*_MAIN

Example: `figlatex_MAIN=figlatex.dtx`

There is one such variable per documents declared in `LU_MASTERS`. It contains the file against which the `latex` (or `pdflatex`, etc.) program must be run.

If not set, *master*`.tex` is used.

Which flavors must be compiled `LU_FLAVORS`

Example: `LU_FLAVORS=DVI DVIPDF`

A flavor can be see as a kind of document (postscript, PDF, DVI, etc.) and the way to create it. For example, a PDF document can be created directly from the `.tex` file (with `pdflatex`), from a `.dvi` file (with `dvipdfm`) or from a postscript file (with `ps2pdf`). This would be three different flavors.

Some flavors are already defined in `LaTeX.mk`. Other flavors can be defined by the user (see section 3.1.2). The list of predefined flavors can be see in the table 1. A flavor can depend on another. For example, the flavor creating a postscript file from a DVI file depends on the flavor creating a DVI file from a LaTeX file. This is automatically handled.

If not set, `PS` and `PDF` are used (and `DVI` due to `PS`).

Flavor	dependency	program variable	Transformation
DVI		LATEX	`.tex` ⇒ `.dvi`
PS	DVI	DVIPS	`.dvi` ⇒ `.ps`
PDF		PDFLATEX	`.tex` ⇒ `.pdf`
DVIPDF	DVI	DVIPDFM	`.dvi` ⇒ `.pdf`

For example, the `DVI` flavor transforms a `*.tex` file into a `*.dvi` file with the `Makefile` command `£(LATEX) £(LATEX\_OPTIONS)`

Table 1: Predefined flavors

Which programs are called and with which options *prog*/*prog*_OPTIONS

Example:
```
DVIPS=dvips
DVIPS_OPTIONS=-t a4
```

Each flavor has a program variable name that is used by `LaTeX.mk` to run the program. Another variable with the suffix `\_OPTIONS` is also provided if needed. See the table 1 the look for the program variable name associated to the predefined flavors.

Other programs are also run in the same manner. For example, the `makeindex` program is run from `LaTeX.mk` with the help of the variables `MAKEINDEX` and `MAKEINDEX_OPTIONS`.

Per target programs and options *master_prog*/*master_prog*_OPTIONS

Example:
```
figlatex_DVIPS=dvips
figlatex_DVIPS_OPTIONS=-t a4
```

Note that, if defined, *master_prog* will ***replace*** *prog* whereas *master_prog*_OPTIONS will ***be added to*** *prog*_OPTIONS (see section 3.2 for more details).

Global and per target dependencies DEPENDS/*master*_DEPENDS

Example:
```
DEPENDS=texdepends.sty
figlatex_DEPENDS=figlatex.tex
```

All flavor targets will depend to theses files. This should not be used as dependencies are automatically tracked.

3 Reference manual

3.1 Flavors

3.1.1 What is a flavor ?

A flavor can be see as a kind of document (postscript, PDF, DVI, etc.) and the way to create it. Several property are attached to each flavor. Currently, there exists two kinds of flavors:

TEX-flavors: these flavors are used to compile a `*.tex` file into a target. A LaTeX compiler (`latex`, `pdflatex`, etc.) is used;

DVI-flavors: these flavors are used to compile a file produced by a TEX-flavors into an other file. Examples of such flavors are all the ones converting a DVI file into another format (postscript, PDF, etc.).

Several properties are attached to each flavors. Most are common, a few a specific to the kind of the flavor.

Name: the name of the flavor. It is used to declare dependencies between flavors (see below). It also used to tell which flavor should be compiled for each document (see the `FLAVORS` variables);

Program variable name: name of the variable that will be used to run the program of this flavor. This name is used for the program and also for the options (variable with the `_OPTIONS` suffix);

Target extension: extension of the target of the flavor. The dot must be added if wanted;

Master target: if not empty, all documents registered for the flavor will be built when this master target is called;

XFig extensions to clean (*TEX-flavor only*): files extensions of figures that will be cleaned for the `clean` target. Generally, there is `.pstex_t .pstex` when using `latex` and `.pdftex_t .pdftex` when using `pdflatex`;

Dependency *DVI-flavor only*: name of the TEX-flavor the one depends upon.

3.1.2 Defining a new flavor

To define a new flavor named `NAME`, one just have to declare a `lu-define-flavor-NAME` that calls and evaluates the `lu-create-flavor` with the right parameters, ie:

- name of the flavor;
- kind of flavor (`tex` or `dvi`);
- program variable name;
- target extension;
- master target;
- XFig extensions to clean *or* TEX-flavor to depend upon.

For example, `LaTeX.mk` already defines:

DVI flavor

```
define lu-define-flavor-DVI
  $$(eval $$(call lu-create-flavor,DVI,tex,LATEX,.dvi,dvi,\
    .pstex_t .pstex))
endef
```

Tip: the `LATEX` program variable name means that the program called will be the one in the `LATEX` variable and that options in the `LATEX_OPTIONS` variable will be used.

PDF flavor

```
define lu-define-flavor-PDF
  $$(eval $$(call lu-create-flavor,PDF,tex,PDFLATEX,.pdf,pdf,\
    .pdftex_t .$$(_LU_PDFTEX_EXT)))
endef
```

PS flavor

```
define lu-define-flavor-PS
  $$(eval $$(call lu-create-flavor,PS,dvi,DVIPS,.ps,ps,DVI))
endef
```

Tip: for DVI-flavors, the program will be invoked with with the option `-o` *`target`* and with the name of the file source in argument.

DVIPDF flavor

```
define lu-define-flavor-DVIPDF
  $$(eval $$(call lu-create-flavor,DVIPDF,dvi,DVIPDFM,.pdf,pdf,DVI))
endef
```

3.2 Variables

`LaTeX.mk` use a generic mechanism to manage variables, so that lots of thing can easily be customized per document and/or per flavor.

3.2.1 Two kind of variables

`LaTeX.mk` distinguish two kind of variables. The first one (called SET-variable) is for variables where only *one* value can be set. For example, this is the case for a variable that contain the name of a program to launch. The second one (called ADD-variable) is for variables where values can be cumulative. For example, this will be the case for the options of a program.

For each variable used by `LaTeX.mk`, there exists several variables that can be set in the Makefile so that the value will be used for all documents, only for one document, only for one flavor, etc.

SET-variable. For each SET-variable *NAME*, we can find in the Makfile:

1	`LU_`*target_NAME*	per document and per flavor value;
2	`TD_`*target_NAME*	per document and per flavor value filled by the `texdepends` LaTeX package;
3	`LU_`*master_NAME*	per document value;
4	*master_NAME*	per document value;
5	`LU_FLAVOR_`*flavor_NAME*	per flavor value;
6	`LU_`*NAME*	global value;
7	*NAME*	global value;
8	`_LU_...`*NAME*	internal `LaTeX.mk` default values.

The first set variable will be used.

Tip: in case of flavor context or document context, only relevant variables will be checked. For example, the SET-variable `MAIN` that give the main source of the document will be evaluated in document context, so only 4, 5, 6, 7 and 8 will be used (and I cannot see any real interest in using 6 or 7 for this variable).

Tip2: in case of context of index (when building indexes or glossary), there exists several other variables per index to add to this list (mainly ending with *_kind_indexname_NAME* or *_kind_NAME*). Refer to the sources if you really need them.

ADD-variable. An ADD-variable is cumulative. The user can replace or add any values per document, per flavor, etc.

1	`LU_`*target_NAME*	replacing per document and per flavor values;
2	*target_NAME*	cumulative per document and per flavor values;
3	`LU_`*master_NAME*	replacing per document values;
4	*master_NAME*	cumulative per document values;
5	`LU_FLAVOR_`*flavor_NAME*	replacing per flavor values;
6	`FLAVOR_`*flavor_NAME*	cumulative per flavor values;
7	`LU_`*NAME*	replacing global values;
8	*NAME*	cumulative global values;

Tip: if not defined, `LU_`*variable* defaults to "`$(`*variable*`) $(_LU_`*variable*`)`" and `_LU_`*variable* contains default values managed by `LaTeX.mk` and the `texdepends` LaTeX package.

Example: the ADD-variable `FLAVORS` is invoked in document context to know which flavors needs to be build for each document. This means that `LU_`*master*`_FLAVORS` will be used.

```
# We override default value for MASTERS
LU_MASTERS=foo bar baz
# By default, only the DVIPDF flavor will be build
FLAVORS=DVIPDF

bar_FLAVORS=PS
LU_baz_FLAVORS=PDF
# there will be rules to build
# * foo.dvi and foo.pdf
#   (the DVIPDF flavor depends on the DVI flavor)
# * bar.dvi, bar.pdf and bar.ps
#   (the PS flavor is added to global flavors)
# * baz.pdf
#   (the PDF flavor will be the only one for baz)
include LaTeX.mk
```

3.2.2 List of used variables

Here are most of the variables used by `LaTeX.mk`. Users should only have to sometimes managed the first ones. The latter are described here for information only (and are subject to modifications). Please, report a bug if some of them are not correctly pickup by the `texdepends` LaTeX package and `LaTeX.mk`.

Name	Kind	Context of use	Description
`MASTERS`	ADD	Global	List of documents to compile. These values will be used as jobname. **Default:** basename of `*.tex` files containing the `\documentclass` pattern
`FLAVORS`	ADD	Document	List of flavors for each document. **Default:** `PS PDF`
`MAIN`	SET	Document	Master `tex` source file **Default:** *master*`.tex`
`DEPENDS`	ADD	Target	List of dependencies
progvarname	SET	Target	Program to launch for the corresponding flavor
progvarname`_OPTIONS`	ADD	Target	Options to use when building the target
`STYLE`	SET	Index	Name of the index/glossary style file to use (`.ist`, etc.)
`TARGET`	SET	Index	Name of the index/glossary file to produce (`.ind`, `.gls`, etc.)
`SRC`	SET	Index	Name of the index/glossary file source (`.idx`, `.glo`, etc.)
`FIGURES`	ADD	Target	Lists of figures included
`BIBFILES`	ADD	Target	Lists of bibliography files used (`.bib`)
`BIBSTYLES`	ADD	Target	Lists of bibliography style files used (`.bst`)
`BBLFILES`	ADD	Target	Lists of built bibliography files (`.bbl`)
`INPUT`	ADD	Target	Lists of input files (`.cls`, `.sty`, `.tex`, etc.)
`OUTPUTS`	ADD	Target	Lists of output files (`.aux`, etc.)
`GRAPHICSPATH`	ADD	Target	`\graphicspath{}` arguments
`GPATH`	ADD	Target	List of directories from `GRAPHICSPATH` without `{` and `}`, separated by spaces
`INDEXES`	ADD	Target	Kinds of index (`INDEX`, `GLOSS`, etc.)
`INDEXES_`*kind*	ADD	Target	List of indexes or glossaries
`WATCHFILES`	ADD	Target	List of files that trigger a rebuild if modified (`.aux`, etc.)
`REQUIRED`	ADD	Target	List of new dependencies found by the `texdepends` LaTeX package
`MAX_REC`	SET	Target	Maximum level of recursion authorized
`REBUILD_RULES`	ADD	Target	List of rebuild rules to use (can be modified by the `texdepends` LaTeX package
`EXT`	SET	Flavor	Target file extension of the flavor
`DEPFLAVOR`	SET	Flavor	TEX-flavor a DVI-flavor depend upon
`CLEANFIGEXT`	ADD	Flavor	Extensions of figure files to remove on clean

4 FAQ

4.1 No rule to make target 'LU_WATCH_FILES_SAVE'

⇒ *When using `LaTeX.mk`, I got the error:*
`make[1]: *** No rule to make target 'LU_WATCH_FILES_SAVE'. Stop.`

`make` is called in such a way that does not allow correct recursive calls. As one can not know by advance how many times LaTeX, bibTeX, etc. will need to be run, `latex-make` use recursive invocations of `make`. This means that in the `LaTeX.mk` makefile, there exist rules such as:

```
$(MAKE) INTERNAL_VARIABLE=value internal_target
```

In order `latex-make` to work, this invocation of `make` must read the same rules and variable definitions as the main one. This means that calling "`make -f LaTeX.mk foo.pdf`" in a directory with only `foo.tex` will not work. Recursive invocations of make will not load `LaTeX.mk`, will search for a `Makefile` in the current directory and will complain about being unable to build the `LU_WATCH_FILES_SAVE` internal target.

The solution is to call `make` so that recursive invocations will read the same variables and rules. For example:
`make -f LaTeX.mk MAKE="make -f LaTeX.mk" foo.pdf`
or (if there is no `Makefile` in the directory):
`env MAKEFILES=LaTeX.mk make foo.pdf`

5 Implementation

5.1 LaTeX.mk

```
⟨*makefile⟩

####[ Check Software ]##############################################
